

Client Requirements

The following configurations are required to perform the HealthCheck. The HealthCheck ONLY reads data from your Boomi Account, and access is only required during of the HealthCheck engagement.

Configure Your Boomi Account for HealthCheck

These instructions are for general understanding. In an actual engagement, we would assist you with these configurations, which are required to execute the HealthCheck. Video can also be found [here](#).

Please note the HealthCheck only reads your Boomi Account's data and doesn't alter it.

1. Create **HealthCheck System User** in your Boomi Account to be evaluated
2. Assign the System User either the Administrator role, or if your licensing allows for custom roles, create a custom role (e.g., HealthCheck Role) with the following Boomi permissions:
 - a. API Access – Use the Boomi API to access account data
 - b. Account Administration – Account configuration and administration
 - c. Build Read Access – Read access to processes and components
 - d. Environment View – Read access to all environments for some features (like Event Streams)
 - e. Execute – Execute or retry available processes
 - f. Licensing – View currently deployed connections and Atom Cloud usage.
 - g. Runtime Management Read Access – Read access to runtime configuration and administration
 - h. View Audit Logs – View and download audit logs
 - i. View Data – View data in process reporting
 - j. View Results – View and monitor process execution activity and logs
3. Verify System User's Role is assigned to Boomi Environments to be evaluated (e.g., Production, Test, etc.)
4. Create **Boomi API Token for System User** to allow HealthCheck to read API data
5. Provide the following 3 items created above to us:
 1. System User's **API Token**
 2. System User's **Login email address**
 3. **Boomi Account ID**
